Digta 422 Update V4.0 B410

- **Formatting of external 2 GB memory cards**

  Until now it was possible to use 1 GB of memory, after an external SD card with 2 GB memory capacity had been formatted in the Digta 422. Firmware B410 allows to make use of the total memory capacity of 2 GB.

- **Device configuration with encryption password**

  To encrypt dictations a proper encryption password for the author is entered into the config.ini system file of the Digta 422 by means of the NetAdministration.exe configuration software. The encryption password is deleted in the system file after it was read-in into the Digta. With firmware B410 the Digta 422 keeps its password, even if settings are changed by means of the Digta Configurator or by editing the config.ini system file – although the new system file doesn't have a password.

- **Switching on and off the PC when the Digta device is connected**

  When a Digta 422 or the docking station was connected to a passive USB Hub in the past, it caused possible problems, if the PC was switched on or off. With version B410, a Digta 422 connected via USB does not cause any problems when the PC is shut down or booted up.

Benefit now from the increased performance and functionality of your Digta.
