

DigtaSoft Speech

The database-based speech processing solution

GRUNDIG

Business Systems

Interface to GoSpeech included

Professional speech processing for the whole organization

With DigtaSoft Speech, speech processing is reinvented. The big difference: The software is database-based and opens up completely new possibilities for collaboration. Larger organizations with several hundred jobs in particular benefit from this. However, it can also be useful from as little as 10 workplaces.

Allocation of rights in accordance with data protection

With DigtaSoft Speech, the access rights can be assigned much more delicate. Clearances can be granted for each user, whether dictator or secretariat, and for each dictation. Data protection is thus optimally guaranteed, especially with sensitive data.

Evaluations at the push of a button

The creation of statistics and the meaningful evaluation of the efficiency of the workflow is possible at the push of a button.

Manage document creation efficiently

The creation of the database and the conception of the user rights are at the beginning. Then each client connects to the central computer. The information from the dictation sheet is also transferred directly to the database, as is the spoken dictation.

Concurrent user license model

DigtaSoft Speech allows more flexible work. The license model is based on concurrent user usage. This means that you only need as many licenses as users work with the software at the same time. An exceedance check reports when the number has been reached, whereby the system tolerates a certain variance. If a regular exceedance is found, the licenses can easily be supplemented via online activation.

Contemporary document workflow

The layer-based software architecture allows flexible integration of other systems through interfaces. That means more flexibility for networking with other sources.

Speech-based document creation was reinvented with DigtaSoft Speech. A drag and drop function is just one of the innovations that result from this.

Interface to GoSpeech

An interface to our AI-based transcription software GoSpeech is already integrated in DigtaSoft Speech. GoSpeech offers excellent speech recognition results in several languages and the respective dialects. This enables the transcription of multi-speaker recordings and the recognition of different speakers. GoSpeech further offers functionalities such as simple searches, keyword assignment and archiving of your audio and video recordings. This is complemented by an intuitive user interface and a customized dictionary for technical terms. GoSpeech is 100% GDPR-compliant and can be installed on-premises.

Conclusion and outlook

DigtaSoft Speech is a new platform that will grow and develop in the future. We would be happy to analyze your workflow and advise you on which solution suits you best.

Always on the safe side

A service contract belongs to DigtaSoft Speech. This keeps you up to date. It includes free upgrades and free support by email, phone and remote maintenance. This way we can guarantee you smooth operation and full satisfaction.
