administration**

DigtaSoft Speech Direct

is based on Nuance Speech technology and enables server-based speech recognition in your own server environment. In this way, medical professionals can create their documents easily and flexibly at their workplace, while you retain full control over your data and the necessary data protection. At the same time, the professional and precise medical speech recognition does not burden the user's PC resources. The software enables physicians to record the patient's history easily, quickly and in detail in the usual quality.

DigtaSoft Speech Direct can be used on all devices in a Windows-based infrastructure, including virtualized PCs and PCs with remote access. This lightweight Windows client application can be downloaded and installed in minutes and connects securely to the medical facility's own server. Access to the user's individual voice profiles can be achieved via all workstations; core specialty-specific vocabularies including phrases and medical formatting rules are available.

High-performance and precise speech recognition is guaranteed. Additional features are e.g. B. customizable voice commands and auto-texts, navigation and voice-based correction. Easy to install, even easier to use. DigtaSoft Speech Direct can be installed on any workstation or laptop in the hospital in just a few minutes without the need for complex configurations. Immediately after installation, users can open the software from the Windows Start menu, place the cursor where you want the recognized text to appear and start dictating - in almost any Windows-based application.

Speech recognition at the cursor

This professional medical speech recognition for working on thin clients allows you to dictate into almost any application in which you can also type. Just put the cursor in the right place and get started!

Digital dictation included

As part of the DigtaSoft Speech product family, you also get a comprehensive workflow solution for digital dictation. In this way, doctors can efficiently create their documents without speech recognition. The transcription then takes place in the transcription service.

Unlimited productivity

The application is available everywhere and without restrictions. This allows doctors to focus on the individual patient story - and not on the IT.

Easy installation

One-click installation at the individual workstations without complex configuration and automatic updates mean less effort for the IT department and immediate availability for the users.

Safe and private

The clients connect to a server component installed on-site in your hospital network; 256-bit encryption ensures that compliance and security guidelines are adhered to. Sensitive data does not leave your company.

Fast IT integration and DMD license extension

The support of thin client hardware, server virtualization and Citrix environments allows quick and easy integration into your existing IT infrastructure. DigtaSoft Speech is compatible with existing Dragon Medical Direct (DMD) installations. Thus, an extension of existing DMD licenses on a speech recognition server is possible. Alternatively, there is the option of upgrading DMD licenses to DigtaSoft Speech Direct.

Best advice – with experts at your side

Are you planning to introduce or optimize speech recognition in your hospital? Then rely on the experts at Grundig Business Systems! In close cooperation with you, we develop a concept, including planning the required server resources, accompany the implementation and train all users.

Reliable service

Grundig Business Systems carries out the installation and offers a complete service for real operation at a fixed price with:

- Telephone hotline and remote desktop (remote maintenance)
- 2nd level support, also for updates
- Firmware and software updates
